Available for these models with lower speed and same physical structure. All model may be followed by Rx or Fxx series suffixes. This test report applies to FFB 40x40x28.0mm series as the right table

Representative Test P/N : FFB0448EN-00EEY

Equipment: 1.Oven: E24-T0161

On/Off Cycles: Every 500 hours

◎ **L<sub>10</sub> Expectancy:** 70,000 hours minimum @ fan rated voltage and the temperature of 40°C

According to the equation for **Weibull distribution**, MTTF = 7×L<sub>10</sub> = 490,000 hours

And we rely on a zero failure Weibull test strategy and accelerated testing technique, to determine the total test time (t) for verifying the above life estimation by the equations,

$$t = 1.036 \times MTTF \times [(B_{r;c})^{\frac{1}{n}} - A_F], \text{ and } A_F = 2^{(Ts-Tu)/10}$$

where, (B<sub>r;c</sub>) is Poisson distribution factor with the failure number of r equal to 0 and

the decimal confidence level of c equal to 0.90(90%).

Herewith , we could assume as right on the basis of above test result. Besides, if the actual test time exceed the required, it comes out that those fans' L<sub>10</sub> expectancy and MTTF are greater than the warrant. ( MTTF : means Mean Time To Failures, it should be used in a non-repairable system setting. Now we show the MTTF in our life report, that's because we will not repair the failed fans during life experiment. MTBF: means Mean Time Between failures, it should be used in a repairable system setting.
